

Intro page:

Basic:

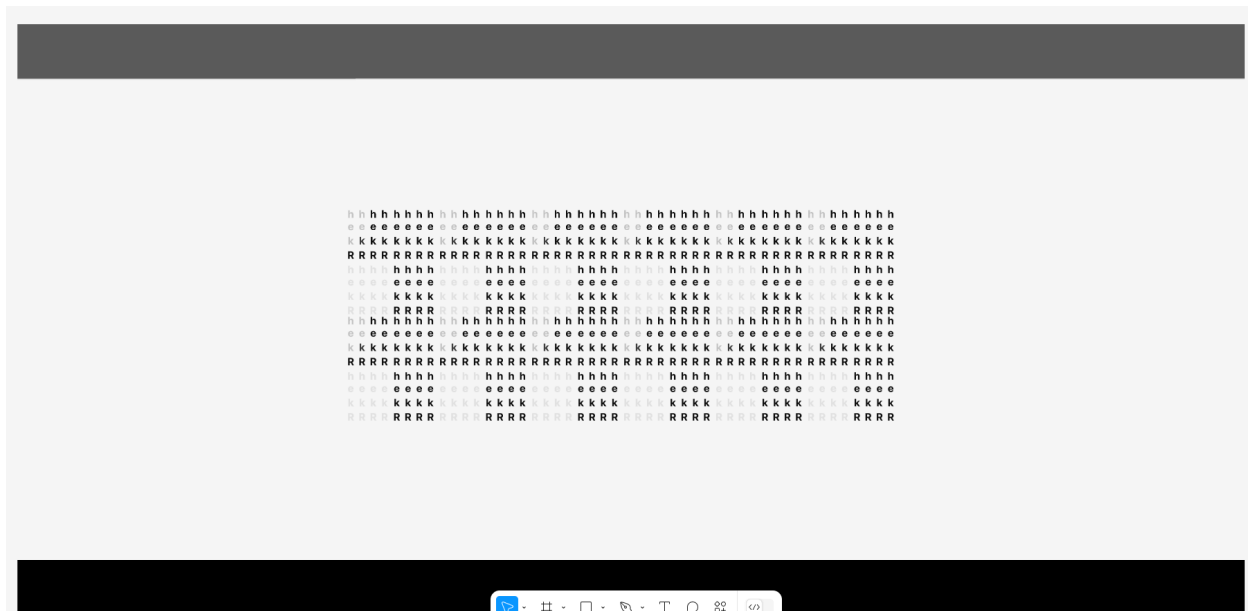

For the basic implementation there are random letters of the original string 'REKHYT' being randomly placed and replaced in a matrix on the screen. Please check the readme from the intro page file, please change the color scheme and background to match this:

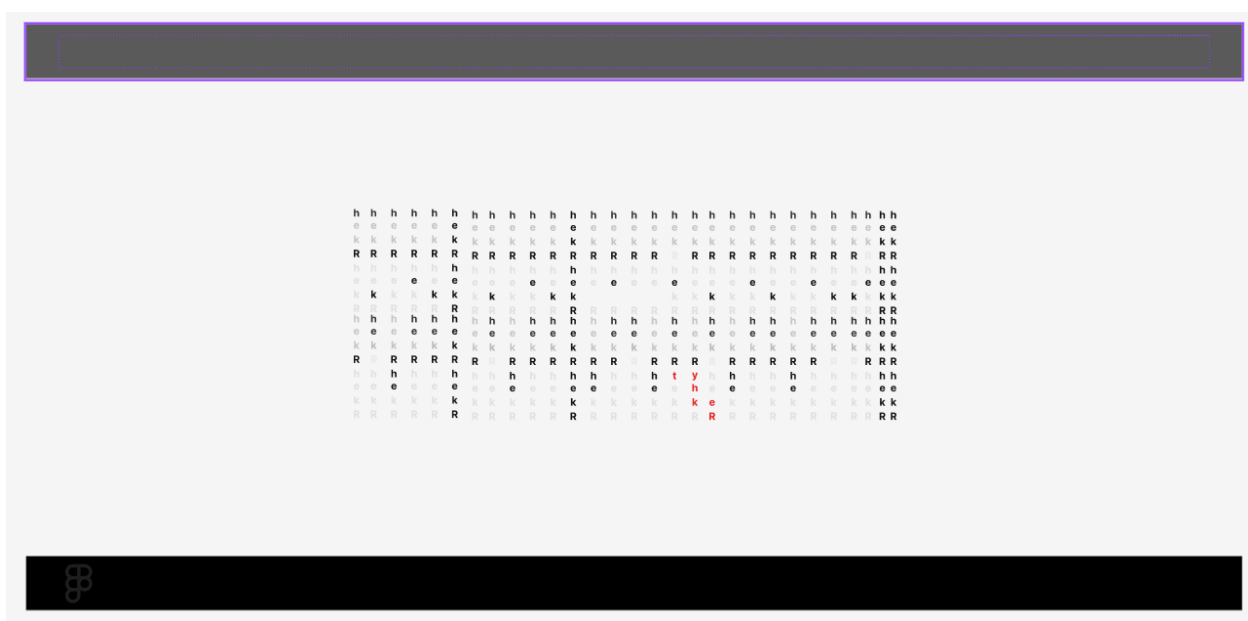

Implement: When any of these characters within the matrix are moused over, a row of characters develop a **black background** and spell out the word **library in bolded white**. While the letters continue to randomly place and replace in the background.

When the mouse is removed 'library' is removed and the letters return to randomly replacing.

Optional bonus implementation: implement a depth first search through the entire matrix of letters after each round of total letter replacements, look for an uninterrupted string of REKHYT in any direction, except diagonals. Once an entire uninterrupted string is found, turn those letters red and play a thundering sound effect. Then Turn those letters black, and return to shuffling until the next search.

When any of these characters within the matrix are moused over, a row of characters develop a black background and spell out the word **library in bolded red**.
