

From the intro page we have the option of clicking on “library”. please implement this such that, after clicking, the user can open up their explorer system or file navigator on their computer to grab a text file, something like this; The intro page menu code is included in the **REKHYT INTRO SCREEN** folder.

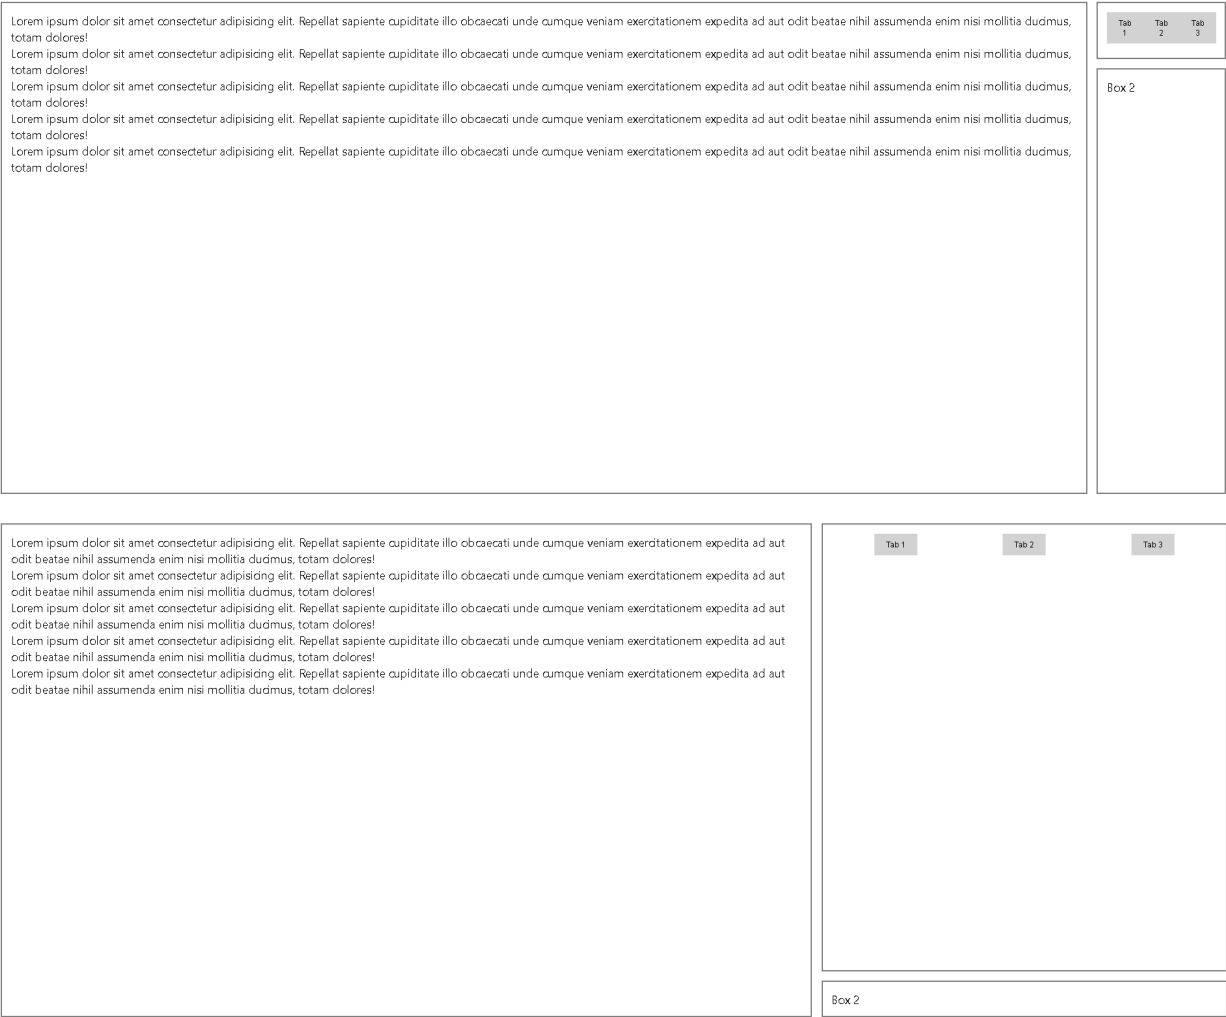

After the user specifies the file, the text should get loaded into our main viewer on the left at 500 words at a time, with little clickable arrow buttons at the bottom to cycle to the next chunk of 500 words or cycle back to the previous. Please place these arrow buttons where the red circle is below. When we reach the end of a text, and there aren't 500 words left for the next forward, just load the rest of whatever is there:

The starter code for this menu screen is included in **anim-main** and already has some basic features implemented. it is responsive to up, down, left, and right keyboard arrow inputs from the user and changes shape accordingly, give it a try!

Here are some screenshots of this:

Auto highlighting:

The starter code for the auto highlighting of words is available in the **wordAutoHighlighting** folder. This feature will be used in combination with **auto audio** below.

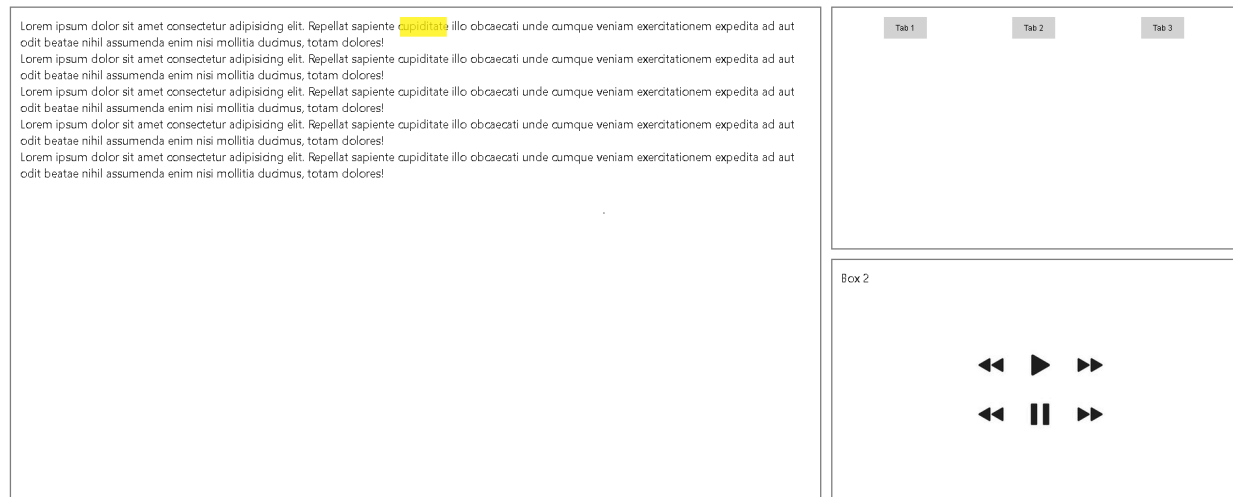

Hello **World** This is a test

Auto audio:

We would like to have every word store it's own audio clip. Then, In the bottom right hand corner box, on the screen, we would like to implement an mp3 button style layout where the corresponding audio can be paused, played, skip a word forward, and skip a word backward. When a word audio is played, the corresponding word should highlight on the screen.

Something like this:

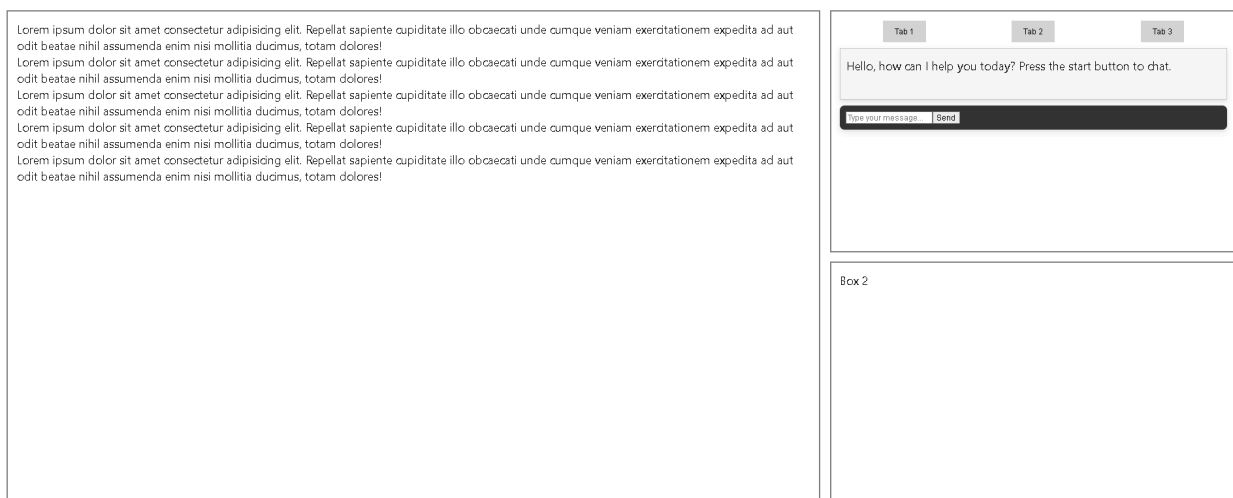

This video helped me with implementing audio responses in code.

Finally AI chat:

The Top right box has tabs where we would like to implement some things later down the line, but for now it is good enough to just have 1 tab, which features an ai chat. I have already begun this implementation in the **design folder**

Here is a screenshot of the progress:

You can test the ai chat, it should be fully functional. I already included the api key.

I used this video as a base: <https://www.youtube.com/watch?v=Q-LUa27m3fA>

Please add a functionality where one can highlight a section of text from the main viewer, right click, and send that highlighted text to the ai for some sort of discussion.

Please add an Option to save/dump ai chat history conversation to an external file.

Bonus: implement some way of saving ones place in a text to return to after they close and reopen the program.

Please implement these functionalities as well as making sure everything looks stylish and pretty in line with this plain, grey, white, black, blocky, style/aesthetic:
